- Be sure to check the delivery specifications before using these products.
- The operation and circuit examples in this document are provided for reference purposes only. Sanken assumes no liability for violation of industrial property, intellectual property, or other rights of Sanken or third parties, that stem from these examples.
- The user must take responsibility for considering and determining which objects the products in this document are used with.
- Although we will continue to improve the quality and reliability of our products, semiconductor products, by their nature, have certain fault and failure rates. The user must take responsibility for designing and checking to secure the device and system so that a part failure may not lead to human injury, fire, damages, or other losses.
- The products in this document are intended for normal electronic devices (such as home appliances, office equipment, communication terminals, or measurement devices). If you are considering using our products for a device that requires high reliability (such as transport machines and their control units, traffic light control systems, disaster prevention, and security equipment or any kind of safety equipment), make sure that you consult our sales representative.
Do not use these products for devices that require extremely high reliability (such as aerospace instruments, nuclear power control units, or life support systems).
- The products in this document are not designed to be radiation-proof.

1-1 Power Management ICs

1-1-1 Power Factor Correction (PFC) ICs

Control ICs

● Continuous Conduction Mode (CCM) PFC Control IC

For high power and high efficiency applications, with brown-in and brown-out functions

| Series Name | Part Number | Oscillation Frequency | Package |
|-------------|-------------|-----------------------|---------|
| SSC2000 | SSC2001S | Fixed to 65kHz | SOP8 |

● Interleaved Discontinuous Conduction Mode (DCM) PFC Control IC

8-pin package, minimum number of discrete components, low noise, and low ripple

| Series Name | Part Number | Maximum on time | Package |
|-------------|-------------|-----------------|---------|
| SSC2100 | SSC2101S | 15μs | SOP8 |
| | SSC2102S | 20.7μs | SOP8 |

1-1-2 AC/DC Converter ICs

● PWM type

<STR-3A100 Series>

- For small power applications
- Low noise, low standby power (Input power $P_{IN} < 15mW$ at no load)

| Part Number | Oscillation Frequency | MOSFET | | Overvoltage and Thermal Protection Operation | Package |
|-------------|-----------------------|------------------------|-------------------------|--|---------|
| | | V _{DSS} (MIN) | R _{DSON} (MAX) | | |
| STR3A151 | 67kHz | 650V | 4.0Ω | Latch | DIP8 |
| STR3A152 | | | 3.0Ω | | |
| STR3A153 | | | 1.9Ω | | |
| STR3A154 | | | 1.4Ω | | |
| STR3A155 | | | 1.1Ω | | |
| STR3A151D | 67kHz | 650V | 4.0Ω | Auto restart | DIP8 |
| STR3A152D | | | 3.0Ω | | |
| STR3A153D | | | 1.9Ω | | |
| STR3A154D | | | 1.4Ω | | |
| STR3A155D | | | 1.1Ω | | |
| STR3A161HD | 100kHz | 700V | 4.2Ω | Auto restart | |
| STR3A162HD | | | 3.2Ω | | |
| STR3A163HD | | | 2.2Ω | | |

<STR-A6000 Series>

- For small power applications
- Low noise, low standby power (Input power $P_{IN} < 25mW$ at no load)
- Brown-in and brown-out functions

| Part Number | Oscillation Frequency | MOSFET | | Package |
|--------------|-----------------------|------------------------|-------------------------|---------|
| | | V _{DSS} (MIN) | R _{DSON} (MAX) | |
| STR-A6051M | 67kHz | 650V | 3.95Ω | DIP8 |
| STR-A6052M | | | 2.8Ω | |
| STR-A6053M | | | 1.9Ω | |
| STR-A6079M | | | 19.2Ω | |
| STR-A6059H | 100kHz | 700V | 6Ω | |
| STR-A6061H | | | 3.95Ω | |
| STR-A6062H | | | 2.8Ω | |
| STR-A6069H | | | 6Ω | |
| STR-A6061HD* | 100kHz | 700V | 3.95Ω | |
| STR-A6062HD* | | | 2.8Ω | |
| STR-A6063HD* | | | 2.3Ω | |
| STR-A6069HD* | | | 6Ω | |

- In addition to normal overcurrent protection, overcurrent protection that operates in the case of a short circuit at the output coil has been added. This overcurrent protection operates during the leading edge blanking period.

<STR-V600 Series>

- Low height, at least 4 mm of creepage isolation between high and low terminal tips
- Low noise, low standby power (Input power $P_{IN} < 25mW$ at no load)
- SIP8 package version of STR-A6000

| Part Number | Oscillation Frequency | MOSFET | | Package |
|-------------|-----------------------|------------------------|-------------------------|---------|
| | | V _{DSS} (MIN) | R _{DSON} (MAX) | |
| STR-V653 | 67kHz | 650V | 1.9Ω | SIP8 |

<STR2W100D Series>

- Low noise, low standby power (Input power $P_{IN} < 25mW$ at no load)

| Part Number | Oscillation Frequency | MOSFET | | Package |
|-------------|-----------------------|------------------------|-------------------------|----------|
| | | V _{DSS} (MIN) | R _{DSON} (MAX) | |
| STR2W152D | 67kHz | 650V | 3.0Ω | TO220F-6 |
| STR2W153D | | | 1.9Ω | |

<STR-W6000S Series>

- Low noise, low standby power (Input power $P_{IN} < 30\text{mW}$ at no load)
- Brown-in and brown-out functions

| Part Number | Oscillation Frequency | MOSFET | | Package |
|-------------|-----------------------|-----------------|--------------------|----------|
| | | V_{DSS} (MIN) | $R_{DS(ON)}$ (MAX) | |
| STR-W6051S | 67kHz | 650V | 3.95Ω | TO220F-6 |
| STR-W6052S | | | 2.8Ω | |
| STR-W6053S | | | 1.9Ω | |

<STR-W6200D Series>

- Low noise, low standby power (Input power $P_{IN} < 40\text{mW}$ at no load)
- External latch protection (ELP) function

| Part Number | Oscillation Frequency | MOSFET | | Package |
|-------------|-----------------------|-----------------|--------------------|----------|
| | | V_{DSS} (MIN) | $R_{DS(ON)}$ (MAX) | |
| STR-W6251D | 67kHz | 650V | 3.95Ω | TO220F-6 |
| STR-W6252D | | | 2.8Ω | |
| STR-W6253D | | | 1.9Ω | |

●Pulse ratio control (PRC) type with off-time period fixed (originated by Sanken Electric)

<STR-A6100 Series>

- For small power applications
- Low noise, low standby power

| Part Number | Fixed off-time period | MOSFET | | Auto standby function | Package |
|-------------|-----------------------|-----------------|--------------------|-----------------------|---------|
| | | V_{DSS} (MIN) | $R_{DS(ON)}$ (MAX) | | |
| STR-A6131 | 8μs | 500V | 3.95Ω | Yes | DIP8 |
| STR-A6132 | | | 2.62Ω | | |
| STR-A6159 | | 650V | 6Ω | | |
| STR-A6151 | | | 3.95Ω | | |
| STR-A6169 | | 800V | 19.2Ω | | |
| STR-A6131M | 11.5μs | 500V | 3.95Ω | No | |
| STR-A6159M | | 650V | 6Ω | | |
| STR-A6151M | | | 3.95Ω | | |
| STR-A6153E | | 800V | 1.9Ω | | |

<STR-V100 Series>

- Low height, at least 4 mm of creepage isolation between high and low terminal tips
- Low noise, low standby power
- SIP8 package version of STR-A6100

| Part Number | Fixed off-time period | MOSFET | | Package |
|-------------|-----------------------|-----------------|--------------------|---------|
| | | V_{DSS} (MIN) | $R_{DS(ON)}$ (MAX) | |
| STR-V152 | 8μs | 650V | 2.8Ω | SIP8 |
| STR-V153 | 11.5μs | | 2Ω | |

●Quasi-resonant type

<STR-Y6700 Series>

- High efficiency in full load range
- Low noise, low standby power

| Part Number | MOSFET | | Package |
|-------------|-----------------|--------------------|----------|
| | V_{DSS} (MIN) | $R_{DS(ON)}$ (MAX) | |
| STR-Y6735 | 500V | 0.8Ω | TO220F-7 |
| STR-Y6753 | 650V | 1.9Ω | |
| STR-Y6754 | | 1.4Ω | |
| STR-Y6763 | 800V | 3.5Ω | |
| STR-Y6765 | | 2.2Ω | |
| STR-Y6766 | | 1.7Ω | |

<STR-Y6400 Series>

- High efficiency in full load range
- Low noise, low standby power
- Mode change delay time adjustable

| Part Number | MOSFET | | Package |
|-------------|-----------------|--------------------|----------|
| | V_{DSS} (MIN) | $R_{DS(ON)}$ (MAX) | |
| STR-Y6453 | 650V | 1.8Ω | TO220F-7 |
| STR-Y6456 | | 0.73Ω | |
| STR-Y6473 | 850V | 3.6Ω | |
| STR-Y6476 | | 1.3Ω | |

<STR-L6400 Series>

- Low height, at least 6.5 mm of creepage isolation between high and low terminal tips
- High efficiency in full load range, low noise, and low standby power
- SIP10 package version of STR-Y6400

| Part Number | MOSFET | | Package |
|-------------|------------------------|-------------------------|---------|
| | V _{DSS} (MIN) | R _{DSON} (MAX) | |
| STR-L6472 | 850V | 6.5Ω | SIP10 |

<STR-L400 Series>

- Low height, at least 6.5 mm of creepage isolation between high and low terminal tips
- Low noise, high efficiency

| Part Number | MOSFET | | Package |
|-------------|------------------------|-------------------------|---------|
| | V _{DSS} (MIN) | R _{DSON} (MAX) | |
| STR-L451 | 650V | 3.95Ω | SIP10 |
| STR-L472 | 900V | 7.7Ω | |

<STR-W6700 Series>

- High efficiency in full load range
- Low noise, undervoltage lockout (UVLO) standby function

| Part Number | MOSFET | | Auto burst operation | Bottom-skip QR operation | Package |
|-------------|------------------------|-------------------------|----------------------|--------------------------|----------|
| | V _{DSS} (MIN) | R _{DSON} (MAX) | | | |
| STR-W6734 | 500V | 1.0Ω | Yes | Yes | TO220F-6 |
| STR-W6735 | | 0.57Ω | | | |
| STR-W6753 | | 1.7Ω | | | |
| STR-W6754 | | 0.96Ω | | | |
| STR-W6756 | | 0.73Ω | | | |
| STR-W6765 | | 1.8Ω | | | |
| STR-W6750F | | 0.73Ω | Yes | No | |
| STR-W6723N | | 1.4Ω | | | |
| STR-W6735N | | 0.57Ω | | | |
| STR-W6756N | | 0.73Ω | | | |
| STR-W6765N | | 1.8Ω | | | |

<STR-X6700 Series>

- High efficiency in full load range
- Low noise, undervoltage lockout (UVLO) standby function

| Part Number | MOSFET | | Auto burst operation | Bottom-skip QR operation | Package |
|-------------|------------------------|-------------------------|----------------------|--------------------------|---------|
| | V _{DSS} (MIN) | R _{DSON} (MAX) | | | |

Application Note

■ Heat Dissipation and Reliability

The reliability of an IC is highly dependent on its operating temperature. Please be sure to apply silicone grease to the IC and to mount it to the heatsink with a proper mounting torque. Heatsink design should pay particular attention to ensuring sufficient heat dissipation capacity. In addition, please take into account the air convection in operation. The reliability of discrete components such as capacitors and coils is closely related to temperature. A high operating temperature may reduce the service life. Exceeding the allowable temperature may burn the coils or damage capacitors. It is important to make sure that the temperature of output smoothing coils and input/output capacitors do not exceed their allowable levels during operation. With an adequate derating for the coils, minimize heat emission as far as possible. (For discrete components, refer to the individual user manuals.)

■ Internal Power Dissipation

P_D can be obtained from the following formula.

- For the device with built-in flywheel diode:

$$P_D = V_o \cdot I_o \left(\frac{100}{\eta\chi} - 1 \right)$$

- For the device with external flywheel diode:

$$P_D = V_o \cdot I_o \left(\frac{100}{\eta\chi} - 1 \right) - V_F \cdot I_o \left(1 - \frac{V_o}{V_{IN}} \right)$$

Efficiency $\eta\chi$ depends on the input/output conditions. Please refer to the efficiency characteristics of the devices. (Posted on the Web site.)

Vo : Output voltage
 VIN : Input voltage
 Io : Output current
 $\eta\chi$: Efficiency(%)
 VF : Diode forward voltage

■ Thermal Design

The maximum junction temperature $T_{J(max)}$ given in the Absolute Maximum Ratings is specific to each product type and must be strictly observed. Thus, thermal design must consider the maximum power dissipation $P_{D(max)}$, which varies by the conditions of use, and the maximum ambient temperature $T_{A(max)}$.

To simplify thermal design, T_a - P_D characteristic graphs are provided herein. Please observe the following steps for heatsink design:

1. Obtain the maximum ambient temperature $T_{a(max)}$.
2. Obtain the maximum power dissipation $P_{D(max)}$.
3. Look for the intersection point on the T_a - P_D characteristic graph and determine the size of the heatsink.

Although the heatsink size is now obtained, in actual applications, 10-to-20% derating factor is generally introduced. Moreover, the heat dissipation capacity of a heatsink highly depends on how it is mounted. Thus, it is recommended to measure the heatsink and case temperature in the actual operating environment.

Please refer to the T_a - P_D characteristic graphs for respective product types.

■ Recommended Silicone Grease

- Shin-Etsu Chemical Co., Ltd.: G746
- Momentive Performance Materials Inc.: YG-6260
- Dow Corning Toray Silicone Co., Ltd.: SC102

Please select proper silicone grease carefully since the oil in some grease products may penetrate the device and result in an extremely short device life.

■ Others

- Devices can not be operated in parallel connection aiming for a larger current.
- Not applicable for the current boost or voltage step-up use.

■T_a-P_D Characteristics

$$P_D = V_o \cdot I_o \left(\frac{100}{\eta\chi} - 1 \right) - V_F \cdot I_o \left(1 - \frac{V_o}{V_{IN}} \right)$$

The efficiency depends on the input voltage and the output current. Therefore, obtain the value from the efficiency graph and substitute the percentage in the formula above.

- Vo : Output voltage
- Io : Output current
- $\eta\chi$: Efficiency (%)
- V_F : Diode D₁ forward voltage
SJPB-D4-0.3V

Thermal design for D₁ must be considered separately.

*: Pin 5 is the ON/OFF pin. Soft start at power on can be performed with a capacitor connected to this pin.

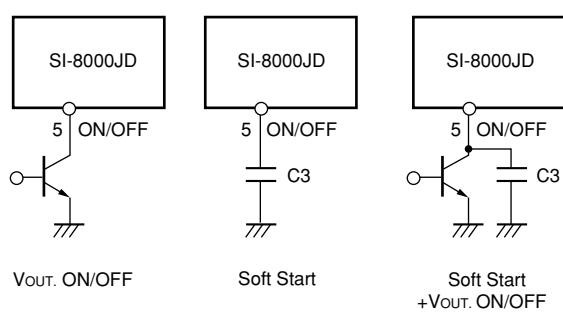

The output can also be turned ON/OFF with this pin.

The output is stopped by setting the voltage of this pin to V_{SSL} or lower.

ON/OFF-pin voltage can be changed with an open-collector drive circuit of a transistor.

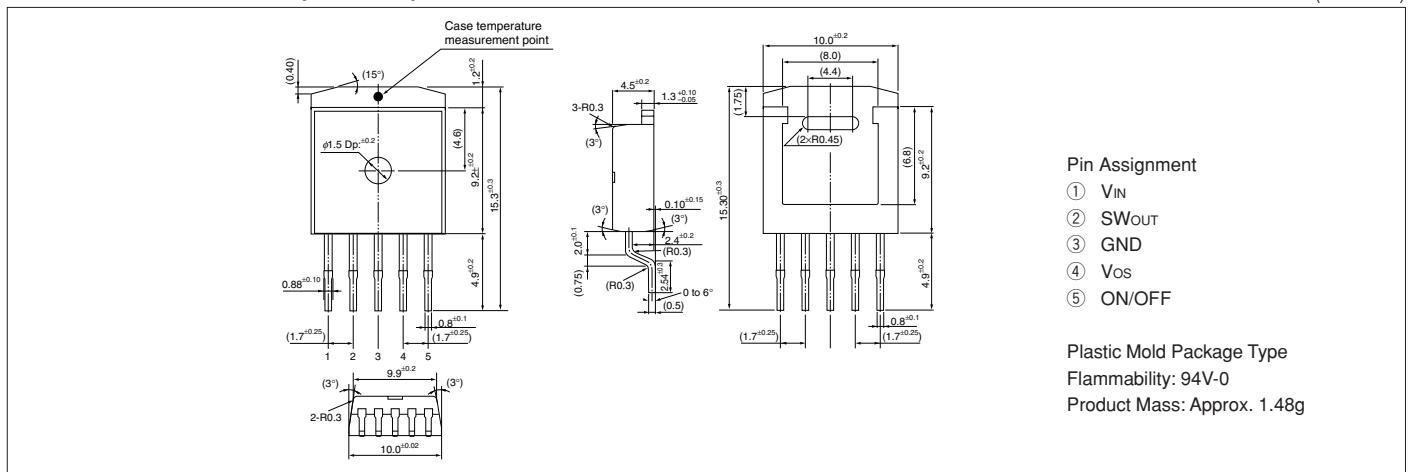

When using both the soft-start and ON/OFF functions together, the discharge current from C₃ flows into the ON/OFF control transistor. Therefore, limit the current securely to protect the transistor if C₃ capacitance is large.

The ON/OFF pin is pulled up to the power supply in the IC, so applying the external voltage is prohibited.

* Pin 5 is a soft start pin. Soft start at power on can be performed with a capacitor connected to this pin.

The output can also be turned ON/OFF with this pin.

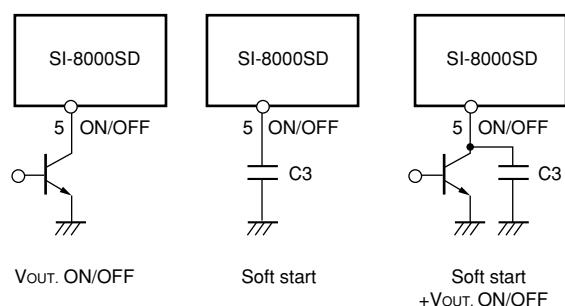

The output is stopped by setting the voltage of this pin to V_{SSL} or lower.

Soft-start pin voltage can be changed with an open-collector drive circuit of a transistor.

When using both the soft-start and ON/OFF pins together, the discharge current from C₃ flows into the ON/OFF control transistor. Therefore, limit the current securely to protect the transistor if C₃ capacitance is large.

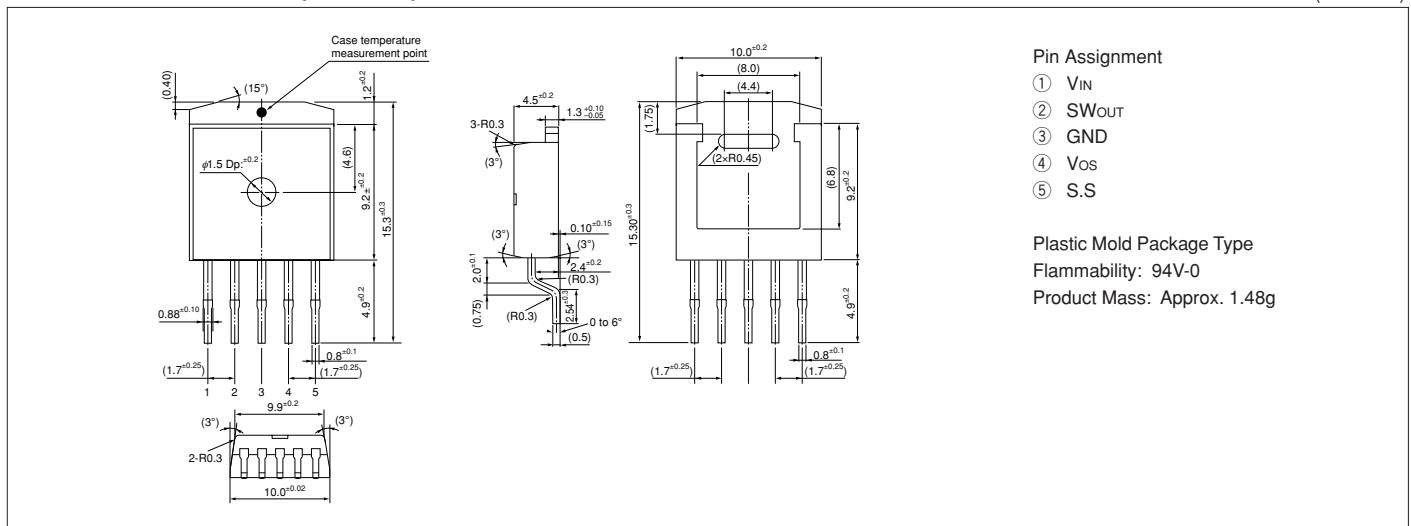

The ON/OFF pin is pulled up to the power supply in the IC, so applying the external voltage is prohibited.

If this pin is not used, leave it open.

SPI-8000A Series**Surface Mount, Separate Excitation Step-down Switching Mode****■Features**

- Surface-mount 16 pin package
- Output current: 3.0A
- High efficiency: 91% (at $V_{IN} = 10V$, $I_O = 1A$, $V_O = 5V$)
- Capable of downsizing a choke-coil due to IC's high switching frequency (250kHz). (Compared with conventional Sanken devices)
- The output-voltage-variable type can vary its output voltage from 1V to 14V because of its low reference voltage (V_{REF}) of 1V.
- Wide Input Voltage Range (8 to 50V)
- Output ON/OFF available
- Built-in overcurrent and thermal protection circuits

■Applications

- Onboard local power supplies
- OA equipment
- For stabilization of the secondary-side output voltage of switching power supplies

 (Sanken)

Diode D1

- Be sure to use a Schottky-barrier diode for D1. If other diodes like fast recovery diodes are used, ICs may be destroyed because of the reverse voltage generated by the recovery voltage or ON voltage.

Choke coil L1

- If the winding resistance of the choke coil is too high, the efficiency may drop below the rated value.
- As the overcurrent protection starting current is about 4.5A, take care concerning heat radiation from the choke coil caused by magnetic saturation due to overload or short-circuited load.

Capacitors C1, C2

- As large ripple currents flow through C1 and C2, use high-frequency and low-impedance capacitors aiming for switching-mode-power-supply use. Especially when the impedance of C2 is high, the switching waveform may become abnormal at low temperatures. For C2, do not use a capacitor with an extremely low equivalent series resistance (ESR) such as an OS capacitor or a tantalum capacitor, which may cause an abnormal oscillation.

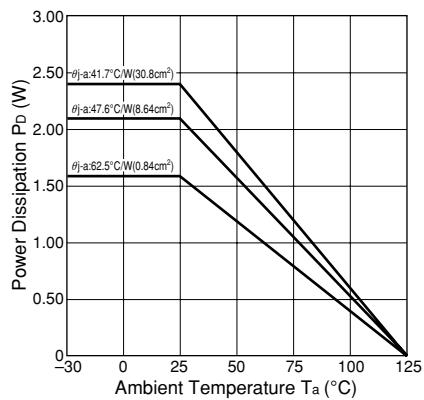

Resistors R2, R3

- R2 and R3 are the resistors to set the output voltage. Set their values so that I_{REF} becomes approx. 2mA. Obtain R₂ and R₃ values by the following formula:

$$R_2 = \frac{(V_{OUT} - V_{REF})}{I_{REF}} = \frac{(V_{OUT} - 1)}{2 \times 10^{-3}} (\Omega), R_3 = \frac{V_{REF}}{I_{REF}} = \frac{1}{2 \times 10^{-3}} \approx 500 (\Omega)$$

◎To create the optimum operating conditions, place the components as close as possible to each other.

■Ta-Pd Characteristics

$$P_d = V_o \cdot I_o \left(\frac{100}{\eta\chi} - 1 \right) - V_F \cdot I_o \left(1 - \frac{V_o}{V_{IN}} \right)$$

Note 1: The efficiency depends on the input voltage and the output current. Therefore, obtain the value from the efficiency graph and substitute the percentage in the formula above.

Note 2: Thermal design for D₁ must be considered separately.

 VIN : Input voltage
 Io : Output current

*1: Pin 5 is the SS pin. Soft start at power on can be performed with a capacitor connected to this pin. The output can also be turned ON/OFF with this pin.

The output is stopped by setting the voltage of this pin to V_{SSL} or lower. SS-pin voltage can be changed with an open-collector drive circuit of a transistor. When using both the soft-start and ON/OFF functions together, the discharge current from C3 flows into the ON/OFF control transistor. Therefore, limit the current securely to protect the transistor if C3 capacitance is large. The SS pin is pulled up (3.7 V typ.) to the power supply in the IC, so applying the external voltage is prohibited. If this pin is not used, leave it open.

*1:"S" may be printed to the right of the marking (except SI-8090S, SI-8120S, SI-8150S).

*2:Pin 5 is a soft start pin. Soft start at power on can be performed with a capacitor connected to this pin.

The output can also be turned ON/OFF with this pin.

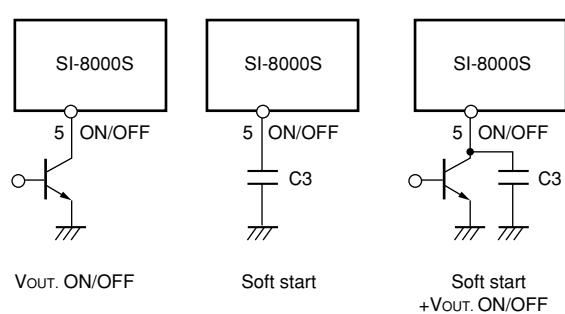

The output is stopped by setting the voltage of this pin to V_{S1L} or lower.

Soft-start pin voltage can be changed with an open-collector drive circuit of a transistor.

When using both the soft-start and ON/OFF functions together, the discharge current from C₃ flows into the ON/OFF control transistor. Therefore, limit the current securely to protect the transistor if C₃ capacitance is large.

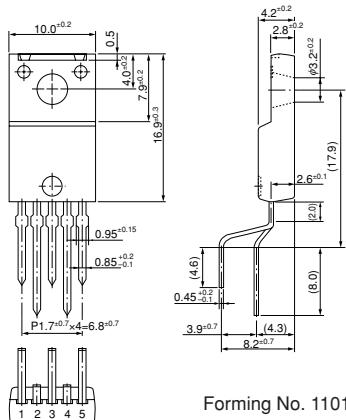

The ON/OFF pin is pulled up to the power supply in the IC, so applying the external voltage is prohibited.

If this pin is not used, leave it open.

■Ta-Pd Characteristics

$$P_D = V_O \cdot I_O \left(\frac{100}{\eta \chi} - 1 \right) - V_F \cdot I_O \left(1 - \frac{V_O}{V_{IN}} \right)$$

The efficiency depends on the input voltage and the output current. Therefore, obtain the value from the efficiency graph and substitute the percentage in the formula above.

SI-8100QL Series Current Mode Control Step-down Switching Mode

■Features

- DIP8 package
- Introduction of current mode control method
- Output current: 3.5A
- High efficiency: 90% ($V_o=5V$)
- Built-in reference oscillator (350kHz)
- Built-in drooping-type overcurrent and thermal protection circuits
- Built-in soft start circuit
- Built-in on/off function (Active Hi)
- Low current consumption during off

■Applications

- DVD recorder, FPD-TV
- Onboard local power supplies
- OA equipment

*: Pin 5 is the SS pin. Soft start at power on can be performed with a capacitor connected to this pin. The output can also be turned ON/OFF with this pin. The output is stopped by setting the voltage of this pin to V_{SSL} or lower. SS-pin voltage can be changed with an open-collector drive circuit of a transistor. When using both the soft-start and ON/OFF functions together, the discharge current from C3 flows into the ON/OFF control transistor. Therefore, limit the current securely to protect the transistor if C3 capacitance is large. The SS pin is pulled up to the power supply in the IC, so applying the external voltage is prohibited. If the pin is not used, leave it open.

^{*1}: Electrical characteristics show the characteristic ratings guaranteed when operating the ICs under the measurement conditions described in the above table.^{*2}: Efficiency is calculated from the following formula.

$$\eta (\%) = \frac{V_O \cdot I_O}{V_{IN} \cdot I_{IN}} \times 100$$

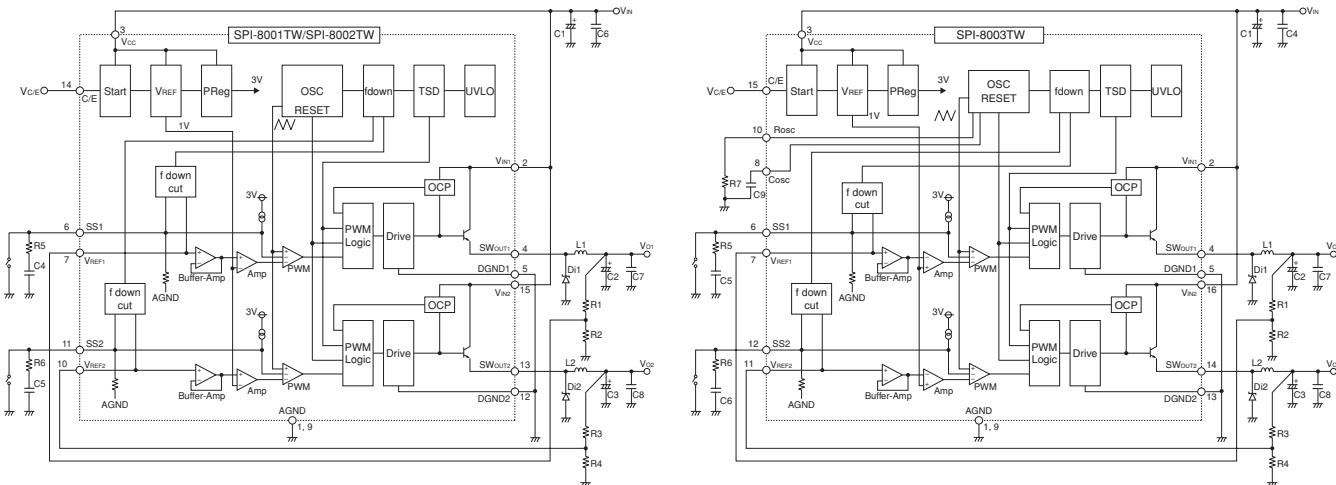

^{*3}: Pin 6 and pin 11 are the SS pins. Soft start at power on can be performed with capacitors connected to these pins. The outputs can also be turned ON/OFF with these pins. The outputs are stopped by setting the voltages of these pins to V_{SSL} or lower. SS-pin voltages can be changed with open-collector drive circuits of transistors.When using both the soft-start and ON/OFF functions together, the discharge currents from C₄ and C₅ flow into the ON/OFF control transistors respectively. Therefore, limit the currents securely to protect the transistors if C₄ and C₅ capacitances are large. The SS pins are pulled up to the power supply in the ICs, so applying the external voltages are prohibited.

Diodes Di1, Di2

- Be sure to use Schottky-barrier diodes for Di1 and Di2.
If other diodes like fast recovery diodes are used, IC may be destroyed because of the reverse voltage generated by the recovery voltage or ON voltage.

Choke coils L1, L2

- If the winding resistance of the choke coil is too high, the efficiency may drop below the rated value.
- As the overcurrent protection starting current is about 2.0A, take care concerning heat radiation from the choke coil caused by magnetic saturation due to overload or short-circuited load.
- Use a closed-magnetic-path coil to prevent interference between the channels SW_{out1} and SW_{out2}.

Capacitors C1, C2, C3

- As large ripple currents flow through C1, C2 and C3, use high-frequency and low-impedance capacitors suitable for switching mode power supplies. Especially when the impedance of C2 and C3 are high, the switching waveforms may become abnormal at low temperatures. For C2 and C3, do not use capacitors with extremely low equivalent series resistance (ESR) such as OS capacitors or tantalum capacitors, which may cause abnormal oscillation.

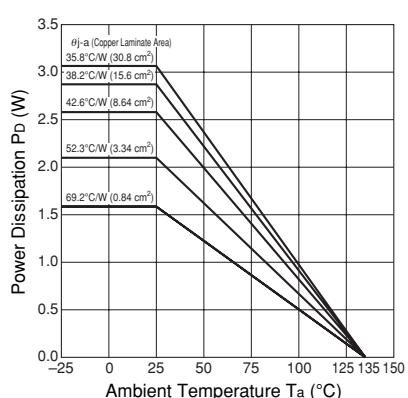

Resistors R1, R2, R3, R4

- R1, R2, R3 and R4 are resistors for setting output voltages. Set the resistors so that I_{REF} is approx. 1 mA. For example, R1 and R2 can be calculated as shown below.

$$R1 = \frac{(V_{O1} - V_{REF1})}{I_{REF1}} = \frac{(V_{O1} - V)}{1 \times 10^{-3}} (\Omega), R2 = \frac{V_{REF1}}{I_{REF1}} = \frac{1}{1 \times 10^{-3}} \approx 1(K\Omega)$$

◎ To create the optimum operating conditions, place the components as close as possible to each other.

■ Ta-Pd Characteristics

$$P_D = V_O \cdot I_O \left(\frac{100}{\eta\chi} - 1 \right) - V_F \cdot I_O \left(1 - \frac{V_O}{V_{IN}} \right)$$

V_O : Output Voltage

V_{IN} : Input Voltage

I_O : Output Current

$\eta\chi$: Efficiency (%)

V_F : D₁ Forward Voltage

SJPB-H6...0.45V (I_O=1A)

Note 1: The efficiency depends on the input voltage and the output current. Therefore, obtain the value from the efficiency graph and substitute the percentage in the formula above.

Note 2: Thermal design for D₁ must be considered separately.

SI-8511NVS**Surface-Mount, Synchronous Rectifier Step-down Switching Mode Control ICs****■Features**

- Surface-mount package (TSSOP24)
- High efficiency due to synchronous rectification: 92% (at $V_{IN} = 5V$, $I_O = 1A$, $V_O = 2.5V$)
- Capable of downsize a choke-coil due to IC's high switching frequency (400kHz typ, On Time Control). (Compared with conventional Sanken devices)
- Low reference voltage (V_{ref}) of 1.1V. The output voltage is variable from 1.1V to 6V.
- High-speed response to a load
- Compatible with low ESR capacitors
- Soft start and output ON/OFF available
- Built-in overcurrent and output-overvoltage protection circuits
- PWRGD function to indicate the output voltage status
- High precision reference voltage: $1.1V \pm 1.2\%$

MOS FET Q₁, Q₂

- Be sure to use logic type MOS FET as Q₁ and Q₂. If you use a normal power MOS FET type, the ON resistance may not drop to a satisfactory level due to a shortage of V_{gs}. This may deteriorate the efficiency and cause overheating.

Diode D₁

- Be sure to use a Schottky-barrier diode for D₁. If other diodes like fast recovery diodes are used, IC may be destroyed because of the reverse voltage generated by the recovery voltage or ON voltage.

Choke coil L₁

- If the winding resistance of the choke coil is too high, the efficiency may drop below the rated value.
- Take care concerning heat radiation from the choke coil caused by magnetic saturation due to overload or short-circuit load.

Capacitor C₁, C₂

- As large ripple currents flow through C₁ and C₂, use high-frequency and low-impedance capacitors suitable for switching mode power supplies. Especially when the impedance of C₂ is high, the switching waveform may become abnormal at low temperatures. For C₂, do not use a capacitor with an extremely low equivalent series resistance (ESR) such as a ceramic capacitor, which may cause an abnormal oscillation.

- * To create the optimum operating conditions, place the components as close as possible to each other.

Application Note

■ Heat dissipation and Reliability

The reliability of an IC is highly dependent on its operating temperature. Please be sure to apply silicone grease to the IC and to mount it to the heatsink with a proper mounting torque. Heatsink design should pay particular attention to ensuring sufficient heat dissipation capacity. In addition, please take into account the air convection in operation.

■ Calculating Internal Power Dissipation(P_D)

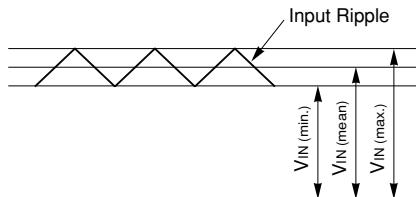

P_D is given by the following formula:

$$P_D = I_o \cdot [V_{IN(\text{mean})} - V_o]$$

Determine the size of the heatsink according to the relationship between allowable power dissipation and ambient temperature.

■ Setting DC Input Voltage

The following is the waveform of a DC input voltage.

When setting the DC input voltage, please follow the instructions below:

- Make $V_{IN(\text{min.})} \geq [(\text{Output voltage}) + (\text{Minimum dropout voltage})]$
- Make $V_{IN(\text{max.})} \leq \text{DC input voltage shown in the "Absolute Maximum Ratings"}$

■ Thermal Design

The maximum junction temperature $T_{j(\text{max})}$ given in the absolute maximum ratings is specific to each product type and must be strictly observed. Thus, thermal design must consider the maximum power dissipation $P_{D(\text{max})}$, which varies by the conditions of use, and the maximum ambient temperature $T_{a(\text{max})}$. To simplify thermal design, T_a - P_D characteristic graphs are provided herein.

Please observe the following steps for heatsink design:

1. Obtain the maximum ambient temperature $T_{a(\text{max})}$.
2. Obtain the maximum power dissipation $P_{D(\text{max})}$.
3. Look for the intersection point on the T_a - P_D characteristic graph and determine the size of the heatsink.

Although the heatsink size is now obtained, in actual applications, 10-to-20% derating factor is generally introduced. Moreover, the heat dissipation capacity of a heatsink highly depends on how it is mounted. Thus, it is recommended to measure the heatsink and case temperature in the actual operating environment.

Please refer to the T_a - P_D characteristic graphs for respective product types.

■ Mounting Torque

| | |
|-----------|--|
| SI-3000KF | 0.588 to 0.686 [N·m] (6.0 to 7.0 [kgf·cm]) |
| SI-3000ZF | |

■ Recommended Silicone Grease

- Shin-Etsu Chemical Co., Ltd.: G746
- Momentive Performance Materials Inc.: YG-6260
- Dow Corning Toray Silicones Co., Ltd.: SC102

Please select proper silicone grease carefully since the oil in some grease products may penetrate the device and result in an extremely short device life.

■ Others

- Devices can not be operated in parallel connection aiming for a larger current.
- Diodes for isolation purpose are provided in between input and ground, and also in between output and ground. They may be broken down if the device is reverse biased. In this case, please clamp the device with low V_F diodes to protect them.

■ Rectifier Diodes for Power Supplies

To rectify the AC input voltage using rectifier diodes for power supplies, please use SANKEN rectifier diodes shown in the following list. (Please use a center-tap or bridge configuration in using stand-alone type diodes.)

*1: V_{IN} (max) and I_O (max) are restricted by the relation $P_D = (V_{IN} - V_O) \times I_O$.

Calculate these values referring to the reference data on next page.

*2: Refer to the Dropout Voltage parameter.

*3: For the SI-3012LU, set the input voltage to $V_{IN} \geq 2.4$ V, and secure the minimum voltage as explained in "Setting DC Input Voltage" section in Linear Regulator Application Note.

Co: Output capacitor (10 μ F or larger)

For SI-3000LU series, Co has to be a low ESR capacitor such as a ceramic capacitor.

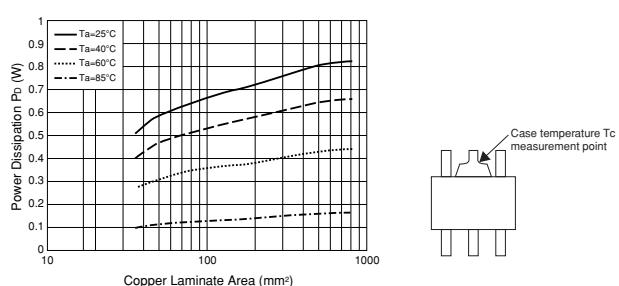

CIN: Input capacitor (10 μ F approx.)• Setting of SI-3012LU output voltage (recommended voltage: 1.5 V to 15 V)
R1 and R2: Resistors for output settingThe output voltage can be set by connecting R1 and R2 as shown in the diagram on the left.
R2: 100 k Ω is recommended

$$R1 = (V_o - V_{ADJ}) / (V_{ADJ} / R2)$$

Copper Laminate Area vs Power Dissipation

T_j=100°C PCB size 40×40

- A monolithic ICs mounts an inner frame stage that is connected to the GND pin (pin 2). Therefore, enlarging the copper laminate area connected to the GND pin improves heat radiation effect.

- Obtaining the junction temperature

Measure the temperature T_c at the lead part of the GND pin (pin 2) with a thermocouple, etc. Then, substitute this value in the following formula to obtain the junction temperature.

$$T_j = P_d \times \theta_{j-c} + T_c \quad (\theta_{j-c} = 5^\circ C/W)$$

NR301E Surface-Mount, Low Dropout Voltage

■Features

- Adjustable Output voltage type
- Output current: 1 A
- $V_{DIF} (V_{IN}-V_{OUT}) \leq 0.6$ V (at $I_o = 1$ A)
- Built-in protection circuits (OCP/TSD*)
- * TSD has temperature hysteresis
- Built-in output ON/OFF function

■Applications

- Secondary stabilized power supply (local power supply)

Copper Laminate Area vs. Power Dissipation

- Obtaining the junction temperature

Measure the temperature T_L at the lead part of the GND pin (pin 7) with a thermocouple, etc. Then, substitute this value in the following formula to obtain the junction temperature.

$$T_j = P_d \times \theta_{j-L} + T_L \quad (\theta_{j-L} = 22^\circ C/W)$$

SI-3000KD Series**Surface-Mount, Low Current Consumption, Low Dropout Voltage****■Features**

- Compact surface-mount package (TO263-5)
- Output current: 1.0A
- Low dropout voltage: $V_{DIF} \leq 0.6V$ (at $I_o = 1.0A$)
- Low circuit current consumption: $I_q \leq 350 \mu A$ (600 μA for SI-3010KD, SI-3050KD)
- Low circuit current at output OFF: $I_q (\text{OFF}) \leq 1 \mu A$
- Built-in overcurrent, thermal protection circuits
- Compatible with low ESR capacitors (SI-3012KD and SI-3033KD)

*3: I_{S1} is specified at the 5% drop point of output voltage V_o on the condition that V_{IN} = overcurrent protection starting current, $I_o = 10$ mA.

*4: Output is OFF when the output control terminal V_c is open. Each input level is equivalent to LS-TTL level. Therefore, the device can be driven directly by LS-TTLs.

*5: SI-3000KFE cannot be used in the following applications because the built-in foldback-type overcurrent protection may cause errors during start-up stage.

(1) Constant current load (2) Positive and negative power supply (3) Series-connected power supply (4) V_o adjustment by raising ground voltage

SI-3000ZF Series 5-Terminal, Low Dropout Voltage

■Features

- Compact full-mold package (equivalent to TO220)
- Output current: 3.0A
- Low dropout voltage: $V_{DIF} \leq 0.7V$ (at $I_o = 3.0A$)
- Low circuit current at output OFF: $I_q (\text{OFF}) \leq 1\mu A$
- Built-in overcurrent and thermal protection circuits

■Applications

- Secondary stabilized power supply (local power supply)

SI-3011ZF

**CIN:** Input capacitor (Approx. 10μF)

This capacitor is required when the input line contains inductance or when the wiring is long.

Co: Output capacitor (47μF or higher)

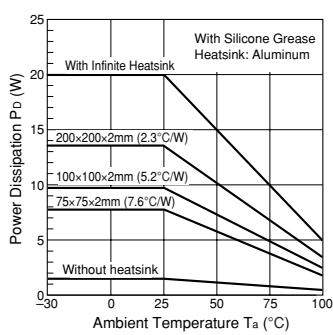

The output voltage may oscillate if a low ESR type capacitor (such as a ceramic capacitor) is used for the output capacitor in SI-3000ZF.

R1, R2: Output voltage setting resistorsThe output voltage can be set by connecting R1 and R2 as shown at left.
The recommended value for R2 is 10kΩ or 11kΩ.

$$R1 = (Vo - V_{ADJ}) / (V_{ADJ}/R2)$$

*: Insert R3 in case of setting Vo to $Vo \leq 1.8V$. The recommended value for R3 is 10kΩ.

Application Note

■ Setup Precautions

- Recommended mounting torque
0.588 to 0.784 [N·m](6.0 to 8.0 [kgf·cm])
- Recommended silicone grease
Shin-Etsu Chemical Co., Ltd.: G746
Momentive Performance Materials Inc.: YG-6260
Dow Corning Toray Silicone Co., Ltd.: SC102
Please select proper silicone grease carefully since the oil in some grease products may penetrate the device and result in an extremely short device life.

■ Handling Precautions

- When using the following products that use C-MOS circuits for input terminals, observe the following.
- SLA707xMR, MPR, MPRT
 - SLA708xMPR
 - SLA6800M Series
 - SMA6800M Series
 - STA713xM
 - STA6940M
 - SPI-6631M
 - SCM1200M Series
 - SX68000M Series
 - SI-66xx Series
 - SIM6800M Series
 - Carefully control the humidity of the room to prevent the buildup of static electricity. Since static electricity is particularly a problem during the winter, be sure to take sufficient precautions.
Take care to make sure that static electricity is not applied to the IC during wiring and assembly. Take precautions such as shorting the terminals of the printed circuit board to ensure that they are at the same electrical potential.

■Features

- Lineup of built-in current sense resistor and built-in protection circuit-type
- Power supply voltages, V_{BB} : 46 V (max), 10 to 44 V normal operating range
- Logic supply voltages, V_{DD} : 3.0 to 5.5 V
- Maximum output currents: 1 A, 1.5 A, 2 A, and 3 A
- Built-in sequencer
- Self-excitation PWM current control with fixed off-time
- Synchronous PWM chopping function prevents motor noise in Hold mode
- Sleep mode for reducing the IC input current in stand-by state
- ZIP type 23-pin molded package (SLA package)

SI-7321M 2-Phase to 4W 1-2 Phase Excitation Support, Built-in Sequencer
■Features

- Power supply voltages, VBB: 46 V (max), 10 to 44 V normal operating range
- Logic supply voltages, VDD: 3.0 to 5.5 V
- Output Current Io: 1.5 A
- Clock input method (built-in sequencer)
- Self-excitation PWM current control with fixed off time
- Synchronous PWM chopping function prevents motor noise in Hold mode
- Sleep mode for reducing the IC input current in stand-by state
- Selectable blanking time (1.8 us or 3.6 us)
- Selectable clock input edge (POS or POS/NEG)
- Selectable protection availability
- 44-pin surface-mount

SI-6633M**■Features**

- Built-in power element, normal operation rated output current $I_{out} = 2A$ (DC)/4A (peak)
- Hall element input
- Provides the following current control functions:
Peak current control fixed frequency PWM (internal PWM)
PWM control (external PWM) based on speed control signal (analog signal)
PWM control (logic PWM) based on logic input
- Protection functions
Overcurrent protection, overvoltage protection
Thermal protection, undervoltage lockout protection
Motor lock detection
- Provides alarm output pin for protection function operation
- Provides pin (FG) to output rotation signal generated by state transition of Hall input
- Built-in synchronous rectifier function that reduces power dissipation
- Built-in switching function for synchronous rectifier operation (Active/Passive)
- Standby mode

Motor lock detection
- Provides alarm output pin for protection function operation
- Provides pin (FG) to output rotation signal generated by state transition of Hall input
- Built-in synchronous rectifier function that reduces power dissipation
- Built-in switching function for synchronous rectifier operation (Active/Passive)
- Standby mode

SX68000MH Series**Surface-Mount, Built-in Overcurrent Protection, Thermal Shutdown, and Overcurrent Limiting Circuits****■Features**

- A package of 6 MOSFET units for 3-phase bridge and pre-drive (HVIC, LVIC)
- Best for driving the fan motor (built-in motor) of air conditioner, etc.
- Built-in boot diode with limited resistance
- Built-in undervoltage lock out (UVLO) circuit
- Built-in overcurrent protection circuit (OCP)
- Built-in Thermal Shut Down (TSD) function
- Built-in current limiter function (OCL)
- Error (FO) terminal with shutdown input function
- 7.5V regulator output function (35mA max.)

- A package of 6 MOSFET units for 3-phase bridge, pre-drive (HVIC, LVIC) and boot diode
- Best for fan motor inverter control
- High side drive of bootstrap method has been employed.
- Built-in undervoltage lock out (auto regression)
- Built-in Thermal detection circuit (no stopping)
- Built-in fail signal output function (for when the overheat detection circuit and UVLO)
- Built-in 7.5 V regulator output (35 mA, max.)
- Supports CMOS (3.3 and 5.0 V) input levels

■Internal Block Diagram

■Typical Connection Diagram

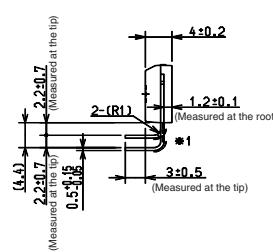

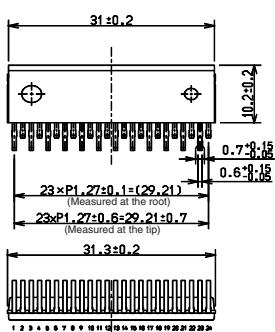

The input pulldown resistor is built into an IC (about $100\text{ k}\Omega$). If the input is expected to be unstable or fluctuate widely, however, it needs to be reinforced with an external resistor.

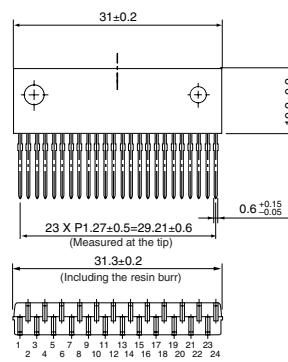

Attach capacitors near IC. Attach a ceramic capacitor in parallel with the electrolytic capacitor if too much noise is generated.

SIM6800M Series

Overcurrent Protection, Thermal Shutdown, Built-in Current Limiting Function, 3 Shunt Support, DIP Package

■Features

- Ideal for driving refrigerator compressors and the fan motor (built-in motor) of air conditioners
- Six MOSFETs for 3-phase bridge and pre-drive circuits (HVIC, LVIC) incorporated in single package
- (For SIM6822M and SIM682227M, the 6 MOSFETs are replaced by 6 IGBTs and 6 FRDs)
- New package (DIP-40) that separates control signal pins and high voltage pins
- 3-shunt configuration allows configuration of vector control
- Built-in boot diode with limiting resistor
- Built-in undervoltage lockout (UVLO) circuit
- Built-in overcurrent protection circuit (OCP)
- Built-in thermal shutdown (TSD) function
- Built-in current limiter function (OCL)
- Error (FO) pin with shutdown input function

■ Internal Block Diagram

The internal block diagram above shows SIM6811M and SIM6812M.

For SIM6822M and SIM6827M, the MOSFETs are replaced by a combination of IGBTs and FRDs.

■ Typical Connection Diagram

W1 must be connected to W2, and V1 must be connected to V2 on the printed circuit board.

The input pulldown resistor is built into an IC (about 22 kΩ). If the input is expected to be unstable or fluctuate widely, however, it needs to be reinforced with an external resistor.

Attach capacitors near IC. Attach a ceramic capacitor in parallel with the electrolytic capacitor if too much noise is generated.

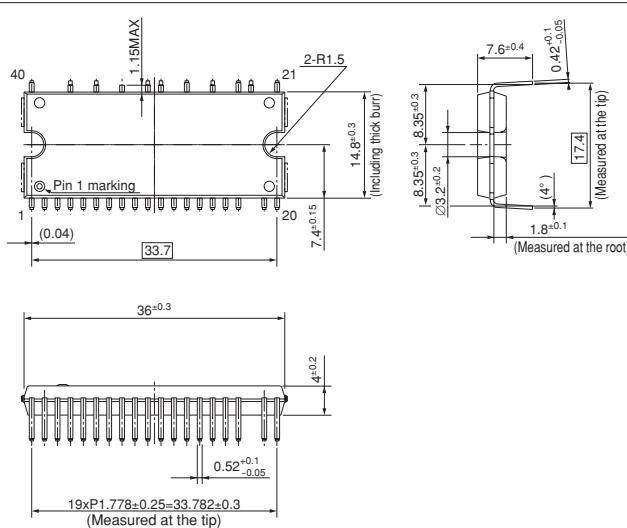

If the current limiter function is not used, leave the OCL pin open, and leave the SD pin open or connect it to GND (if there is a lot of external noise).

The typical connection diagram above shows SIM6811M and SIM6812M.

For SIM6822M and SIM6827M, the MOSFETs are replaced by a combination of IGBTs and FRDs.

SCM1240M Series

IGBT Output Element, Built-in Thermal Shutdown, Overcurrent Protection, and Shoot Through Prevention Circuits

■Features

- Six IGBTs and six FRDs for the 3-phase bridge, a pre-drive IC, and a boot diode are integrated into a single package
(For SCM1248M, the 6 IGBTs and 6 FRDs are replaced with 6 MOSFETs)
- Best for driving air conditioner compressors, washing machine drums, and refrigerator compressors
- Built-in shoot through prevention (STP) circuit (when the ON signal is input simultaneously)
- All IGBTs can be shut down when commonly connected to the FO pin.
- Three built-in boot diodes with limiting resistors
- Built-in undervoltage lock out (UVLO) circuit
- Built-in overcurrent protection (OCP) circuit
- Built-in thermal shut down (TSD) circuit
- Fail signal output during operation of the UVLO (low side only), OCP, or STP circuit
- Supports CMOS (3.3 and 5 V) input levels

LC5200 Series LED Driver ICs

■Features

- Buck converter operations
- High breakdown voltage supply input: 250V (MAX), 450V (MAX)
- Built-in constant current control circuit
Built-in PWM type constant current control circuit
Output current can be controlled by REF pin input voltage
- Supports external PWM signal
Inputting PWM signal to PWM pin enables dimming control
Inputting Low signal to PWM pin enables turning off of all LED loads
- Protection functions
Undervoltage lockout function (UVLO)
Overcurrent protection function (OCP)...Latch shutdown
Thermal shutdown function (TSD)...Auto restart

■Applications

- LED light bulbs
- LED lighting equipment

LC5550 Series High Efficiency, High Power Factor LED Driver ICs

■Features

- Buck converter operations
- Supports PWM type and Quasi-resonant type control
- Built-in ON time control circuit
(Average current control enables high power factor)
- Built-in soft start function
(Reduces load on power MOSFET and secondary side rectifier diodes at power-on)
- Built-in bias assist function
(Improves startup, suppresses VCC voltage drop during operation, lowers capacitance of VCC capacitor, and enables backup of the control circuit supply by using a ceramic capacitor)
- Built-in leading edge blanking function
- Built-in maximum ON time control circuit
- Protection function
Overcurrent protection (OCP)...Pulse by pulse
Overvoltage protection (OVP)...Latch shutdown
Overload protection (OLP)...Latch shutdown
Thermal shutdown (TSD)...Latch shutdown

LC5510 Series LED Driver ICs with Harmonics Standard (IEC61000-3-2 Class C) at all load condition

■Features

- Non-isolated type
- Built-in ON time control circuit
(Average current control enables high power factor)
- Built-in soft start function
(Reduces load on power MOSFET and secondary side rectifier diodes at power-on)
- Built-in bias assist function
(Improves startup, suppresses VCC voltage drop during operation, lowers capacitance of VCC capacitor, and enables backup of the control circuit supply by using a ceramic capacitor)
- Built-in leading edge blanking function
- Built-in maximum ON time control circuit
- Protection function
Overcurrent protection (OCP)...Pulse by pulse
Overvoltage protection (OVP)...Auto restart
Overload protection (OLP)...Auto restart
Thermal shutdown (TSD)...Latch shutdown

For the polarity of current values, the sink is defined as "positive" and the source is defined as "negative" with respect to the IC.

*1: The relationship V_{CC(BIAS)1} > V_{CC(OFF)} holds true for all products.

*2: Thermal resistance between the MOSFET channel and the case. The case temperature T_c is determined by the temperature at the center of the marking surface.

LC5540 Series LED Driver ICs with Harmonics Standard (IEC61000-3-2 Class C) at all load condition

■Features

- Isolated type
- Built-in ON time control circuit
(Average current control enables high power factor)
- Built-in soft start function
(Reduces load on power MOSFET and secondary side rectifier diodes at power-on)
- Built-in bias assist function
(Improves startup, suppresses VCC voltage drop during operation, lowers capacitance of VCC capacitor, and enables backup of the control circuit supply by using a ceramic capacitor)
- Built-in leading edge blanking function
- Built-in maximum ON time control circuit
- Avalanche energy capacity guaranteed
(Enables simplification of the surge absorption circuit.)
- Protection function
Overcurrent protection (OCP)...Pulse by pulse
Overvoltage protection (OVP)...Latch shutdown
Overload protection (OLP)...Latch shutdown
Thermal shutdown (TSD)...Latch shutdown

■Applications

- LED light bulbs
- LED lighting equipment

Application Note

Since reliability can be affected adversely by improper storage environment or handling methods during Characteristic tests, please observe the following cautions.

■ Cautions for Storage

- Ensure that storage conditions comply with the normal temperature (5 to 35°C) and the normal relative humidity (around 40 to 75%), and avoid storage locations that experience high temperature and humidity, or extreme changes in temperature or humidity.
- Avoid locations where dust or harmful gases are present, and avoid direct sunlight.
- Reinspect the devices for rust in leads and solderability after stored for a long time.

■ Cautions for Characteristic Tests and Handling

On characteristics test at incoming inspection, etc, take good care to avoid the surge voltages from the test equipment, the short circuit at terminals, or the wrong connection.

■ Silicone Grease

When using a heatsink, please coat thinly and evenly the back surface of the device and both surfaces of the insulating plate with silicone grease to lower the thermal resistance between the device and the heatsink. Please select proper silicone grease carefully since the oil in some grease products may penetrate the device and result in an extremely short device life.

Recommended Silicone Grease

- G-746 (Shin-Etsu Chemical)
- YG6260 (Momentive Performance Materials Inc.)
- SC102 (Dow Corning Toray Silicone)

■ Mounting Torque

When mounting torque is insufficient, thermal resistance increases, and so heat radiation effect is decreased. When the torque is excessive, the screw may be broken, the heatsink may be deformed, and the device frame may be distorted, resulting in the device damage. Recommended mounting torque per package is as follows:

● Mounting Torque Table

| Package | Screw Torque |
|------------------------------|-----------------------------------|
| TO-220 | 0.490 to 0.686 N·m (5 to 7kgf·cm) |
| TO-220F (FM20) | |
| TO-3P (MT-100) | 0.686 to 0.882 N·m (7 to 9kgf·cm) |
| TO-3PF(FM100) | |
| MT-200 (fixed at two points) | 0.588 to 0.784 N·m (6 to 8kgf·cm) |
| SIP with Fin (SLA) | |

- * When the surface of a heatsink where Full Mold package is to be mounted is not flat due to the burred metal bracket for screwing around the mounting hole of the heatsink, the resin of the package might be cracked even if the torque is lower than the recommended value.
- * When a screw is fastened with an air driver for the Full Mold package, a large impact is generated at the time of stop, and the resin may crack even if the torque is lower than the recommended value. An electric driver, therefore, should be used instead of an air driver.

■ Heatsink

A larger contact area between the device and the heatsink is required for more effective heat radiation. To ensure a larger contact area, minimize mounting holes. And select a heatsink with a surface smooth enough and free from burrs and slivers.

■ Soldering Temperature

In general, the device mounted on a printed circuit board is subjected to high temperatures from flow solder in a solder bath, or, from a soldering iron at hand soldering.

The testing method and test conditions for a device's heat resistance to soldering are:

At a distance of 1.5mm from the device's main body, apply 260°C for 10 seconds, and 350°C for 3 seconds.

Please observe these limits and finish soldering in as short a time as possible.

■ Antistatic Measure for Power MOS FET Arrays

- When handling the device, body grounding is necessary. Wear a wrist strap with a 1 MΩ resistor close to the body in the wrist strap to prevent electric shock.
- Use a conductive tablemat and a floor mat at the device-handling workbench and ground them properly.
- When using a curve tracer or other measuring equipment, ground them as well.
- In soldering, ground the soldering iron tip and the solder bath to prevent a leakage voltage from damaging the device.
- As an antistatic measure for device containers, use Sanken shipping containers or a conductive containers, or use aluminum foils. Since reliability can be affected adversely by improper storage environment or handling methods during Characteristic tests, please observe the following cautions.

Application Note

Since reliability can be affected adversely by improper storage environment or handling methods during Characteristic tests, please observe the following cautions.

■ Cautions for Storage

- Ensure that storage conditions comply with the normal temperature (5 to 35°C) and the normal relative humidity (around 40 to 75%), and avoid storage locations that experience high temperature and humidity, or extreme changes in temperature or humidity.
- Avoid locations where dust or harmful gases are present, and avoid direct sunlight.
- Reinspect the devices for rust in leads and solderability after stored for a long time.

■ Cautions for Characteristic Tests and Handling

On characteristics test at incoming inspection, etc, take good care to avoid the surge voltages from the test equipment, the short circuit at terminals, or the wrong connection.

■ Silicone Grease

When using a heatsink, please coat thinly and evenly the back surface of the device and both surfaces of the insulating plate with silicone grease to lower the thermal resistance between the device and the heatsink. Please select proper silicone grease carefully since the oil in some grease products may penetrate the device and result in an extremely short device life.

Recommended Silicone Grease

- G-746 (Shin-Etsu Chemical)
- YG6260 (Momentive Performance Materials Inc.)
- SC102 (Dow Corning Toray Silicone)

■ Mounting Torque

When mounting torque is insufficient, thermal resistance increases, and so heat radiation effect is decreased. When the torque is excessive, the screw may be broken, the heatsink may be deformed, and the device frame may be distorted, resulting in the device damage. Recommended mounting torque per package is as follows:

● Mounting Torque Table

| Package | Screw Torque |
|-------------------------|-----------------------------------|
| TO220 | 0.490 to 0.686 N·m (5 to 7kgf·cm) |
| TO220F-A, TO220F (FM20) | |
| TO3P (MT100) | 0.686 to 0.882 N·m (7 to 9kgf·cm) |
| TO3PF (FM100) | |

* When the surface of a heatsink where Full Mold package is to be mounted is not flat due to the burred metal bracket for screwing around the mounting hole of the heatsink, the resin of the package might be cracked even if the torque is lower than the recommended value.

* When a screw is fastened with an air driver for the Full Mold package, a large impact is generated at the time of stop, and the resin may crack even if the torque is lower than the recommended value. An electric driver, therefore, should be used instead of an air driver.

■ Heatsink

A larger contact area between the device and the heatsink is required for more effective heat radiation. To ensure a larger contact area, minimize mounting holes. And select a heatsink with a surface smooth enough and free from burrs and slivers.

■ Soldering Temperature

In general, the device mounted on a printed circuit board is subjected to high temperatures from flow solder in a solder bath, or, from a soldering iron at hand soldering.

The testing method and test conditions for a device's heat resistance to soldering are:

At a distance of 1.5mm from the device's main body, apply 260°C for 10 seconds, and 350°C for 3 seconds.

Please observe these limits and finish soldering in as short a time as possible.

Since reliability can be affected adversely by improper storage environment or handling methods during Characteristic tests, please observe the following cautions.

Application Note

■ General Description

(1) Lead Forming

When forming leads, hold the lead wire on the main body's side so as to prevent stress from being applied to the main body.

(2) Mounting

To mount a frame-type diode on a heatsink, use its screw hole. Do not fix its resin body as the silicon chip may get broken.

(3) Temperature Measurement

For an axial type diode, measure the temperature of the lead wire on the main body side. The thermocouple to be used must be as thin as possible (approximately $\phi 0.125\text{mm}$).

(4) Temperature Rise Consideration

A diode's temperature increases due to losses from forward current, reverse current and reverse recovery time. In normal use, losses are mainly attributable to forward current and voltage. However, in high frequency circuits such as switching power supplies, losses due to reverse recovery time also occurs. Moreover, in diodes having large reverse currents like Schottky barrier diode losses due to reverse current cannot be disregarded. Forward loss tends to decrease at high temperatures. However, reverse loss tends to increase at high temperatures. Therefore, it is necessary to consider the ambient temperature when verifying operation.

(5) Inrush Current

In a capacitor-input type rectifier circuit, inrush current flows when the power supply is switched on. The peak value of this inrush current shall be set less than peak forward surge current I_{FSM} (I^2t can also be obtained but set the minimum pulse width to 1 msec). The value of I_{FSM} is guaranteed for a single shot only. If the inrush current is repeated within a short period of time, the derating has to be taken into account.

(6) Peak Value Current

Considering normal use, limit of the peak value current must be set to 10 times of the average current I_A (AV). If the peak value increases, the diode's forward loss also increases. In this case, check the temperature rise.

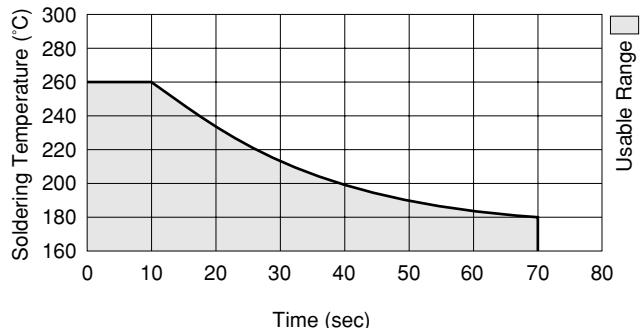

- Carefully study the mounting method when the usage environment is prone to creeping discharge.

■ Surface-Mount Diodes

(Part Number Type: SJP)

Soldering (common to flow and reflow)

- Use rosin based flux. Never use acidic fluxes.
- To prevent a large thermal stress, preheat within 1 to 2 minutes at 150°C and solder within the usable range shown below.

- For using a soldering iron, use the following references:

Temperature of soldering iron tip:

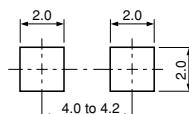

Lower than 300°C
(Power of the soldering iron: 30W or lower)

The soldering tip must be as thin as possible.

Soldering time: Less than 10 seconds

Marking Guide

1 Axial (A0)

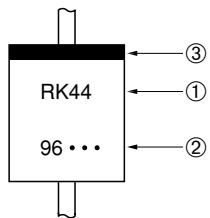

- ①Part Number (abbreviation)
The AM01 is indicated as "M."
- ②Class
Z: 200V None: 400V A: 600V
B: 800V C: 1000V
- ③Manufacturing date
First letter: Year (Last digit of year)
Second letter: Month (1 to 9, O, N, D)
- ④Cathode band: Continuous band
Color of the band: White(Yellow for AU02 series)

2 Axial (E0, E1)

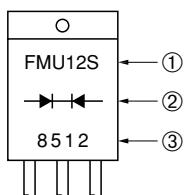

- ①Part Number (abbreviation)
EM01, EM2, EM1 are indicated as MO, M2 and M1, respectively.
- ②Class
Z: 200V None: 400V A: 600V
B: 800V C: 1000V F: 1500V
But EU02A is indicated as A2 and EU2YX as Y.
- ③Manufacturing date
First letter: Year (Last digit of year)
Second letter: Month (1 to 9, O, N, D)
- ④Manufacturing period
 - First 10 days of month
 - Middle 10 days of month
 - Last 10 days of month

3 Axial (R1, R2, R3, R4)

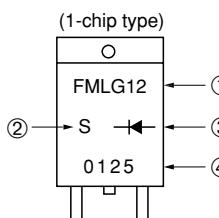

- ①Part Number: 2 set marking
- ②Manufacturing date and period: 2 set marking
 - First letter: Year (Last digit of year)
 - Second letter: Month (1 to 9, O, N, D)
 - First 10 days of month
 - Middle 10 days of month
 - Last 10 days of month
- ③Cathode band
 - Color of the band: White: For Power Supply and SBD
Yellow: For Medium speed
Red: For Fast and ultrafast

4 TO-220F type

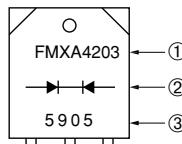

- ①Part Number
FMU-12S is indicated as "FMU12S."
- ②Polarity: Rectifier Symbol
- ③Lot No.
First letter: Year (Last digit of year)
Second letter: Month (1 to 9, O, N, D)
Third and fourth letters: Day
Laser marking or White ink marking

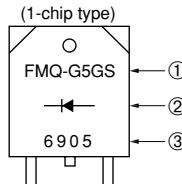

- ①Part Number: Excluding last letter
FML-G12S is indicated as "FML-G12."
- ②Last letter of Part Number
- ③Polarity: Rectifier Symbol
- ④Lot No.
First letter: Year (Last digit of year)
Second letter: Month (1 to 9, O, N, D)
Third and fourth letters: Day
Laser marking or White ink marking

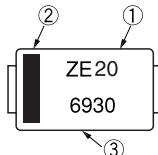

5 TO-3PF, FM100 type

- ①Part Number: Full name
- ②Polarity: Rectifier Symbol
- ③Lot No.
First letter: Year (Last digit of year)
Second letter: Month (1 to 9, O, N, D)
Third and fourth letters: Day
Laser marking or White ink marking

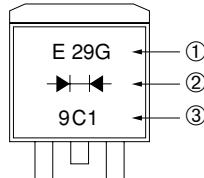

6 Surface-Mount (SJP)

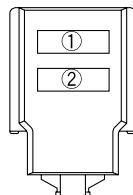

- ①Part Number
- ②Polarity: Rectifier Symbol
- ③Lot No.
First letter: Year (Last digit of year)
Second letter: Month (1 to 9, O, N, and D)
Third and fourth letters: Day

7 Surface-Mount (TO-220S)

- ①Part Number
- ②Polarity: Rectifier Symbol
- ③Lot No.
First letter: Year (Last digit of year)
Second letter: Month (A to M except I)
Third letter: Week

8 SZ-10 Series

- ①Part Number
- ②Lot No.
First letter: Year (Last digit of year)
Second letter: Month (1 to 9, O, N, and D)
Third letter: Day

9 Silicon Varistors

Application Note

<Mold Type>

■ Heat Dissipation and Reliability

Generally, the service life of electronic parts becomes shorter as the temperature increases. Electronic parts can be used without fins, depending on the input and output conditions, but suppressing increases in temperature is the most effective way to enable longer use. The package temperature can be reduced by derating the output current. To get the desired expected service life, implement cooling techniques such as attaching heatsinks or carrying out forced air cooling by using fans. Pay attention to heat dissipation. When mounting the module power supply on the heatsink, make sure to apply silicone grease and attach it securely. Allow sufficient margins in heatsink design. To thoroughly dissipate the heat, consider implementing air convection.

The reliability of input/output capacitors is related to temperature. A high operating temperature may reduce the service life. Only use the capacitors in applications recommended by the capacitor manufacturer.

■ Internal Power Dissipation

P_D can be obtained from the following formula.

$$\begin{aligned} P_D &= P_{in} - P_{o} \\ &= V_{in} \times I_{in} - V_{o} \times I_{o} \end{aligned}$$

Or, if Efficiency η is known,

$$P_D = P_o + (\eta \div 100) - P_o$$

P_D : Internal power dissipation
 P_{in} : Input power
 P_o : Output power
 V_{in} : Input voltage
 I_{in} : Input current
 V_o : Output voltage
 I_o : Output current
 η : Efficiency

■ Thermal Design

The maximum junction temperature $T_{j(max)}$ given in the Absolute Maximum Ratings is specific to each product type and must be strictly observed. Thus, thermal design must consider the maximum power dissipation $P_{D(max)}$, which varies according to the conditions of use, and the maximum ambient temperature $T_{a(max)}$.

To simplify thermal design, T_a - P_D characteristic graphs are provided herein. Please observe the following steps for heatsink design:

1. Obtain the maximum ambient temperature $T_{a(max)}$.
2. Obtain the maximum power dissipation $P_{D(max)}$.
3. Look for the intersection point on the T_a - P_D characteristic graph and determine the size of the heatsink.

Although the heatsink size is now obtained, in actual applications, derating factor of 10-to-20% is generally used. Moreover, the heat dissipation capacity of a heatsink highly depends on how it is mounted. Thus, it is recommended to measure the heatsink and case temperature in the actual operating environment.

For details, refer to the T_a - P_D characteristic graphs for each product type.

■ Recommended Silicone Grease

- Shin-Etsu Chemical Co., Ltd.: G746
- Momentive Performance Materials Inc.: YG-6260
- Dow Corning Toray Silicone Co., Ltd.: SC102

Be sure to select proper silicone grease carefully since the oil in some grease products may penetrate the device, resulting in an extremely short device life.

■ Other notes

- Devices cannot be operated connected in parallel in order to obtain a larger current.
- Module power supplies cannot be used for current boosting or voltage step-up applications.

MPM Series Step-down Synchronous Rectifier Type DC/DC Converter Module

■Features

- Switch element, coil, control circuit and peripheral components incorporated in single package
- Fewer external parts: Only 3 components required: Cin, Co, and RFB
- Oscillation frequency: 250kHz
- Synchronous rectifier type
- High efficiency: 91% typ (VIN=33V, VO=12V, IO=3A)
- Built-in H/S (40mΩ typ.), L/S (26mΩ typ.) ON resistance switching MOSFETs
- Full mold, stand-alone, IC type package: SIP9 (resin dimensions 24×23×5.5mm)

■Applications

- FA equipment, communication equipment
- Consumer equipment, gaming equipment
- Other

*2: The recommended operating conditions show the operating conditions required to maintain normal circuit functions as shown in the electrical characteristics.

In actual operation, the device must be used within the recommended operating conditions.

*3: But the device must be used within the derating curve.

*4: The minimum value of the input voltage range is the higher of 9V or VO+4V.

*5: The electrical characteristics are characteristic values guaranteed when the IC is operated under the measurement conditions shown for each of the items in the table above.

*6: The efficiency is calculated by Formula 1.

$$\eta (\%) = \frac{VO \times IO}{VIN \times lin} \times 100 \quad \text{Formula 1}$$

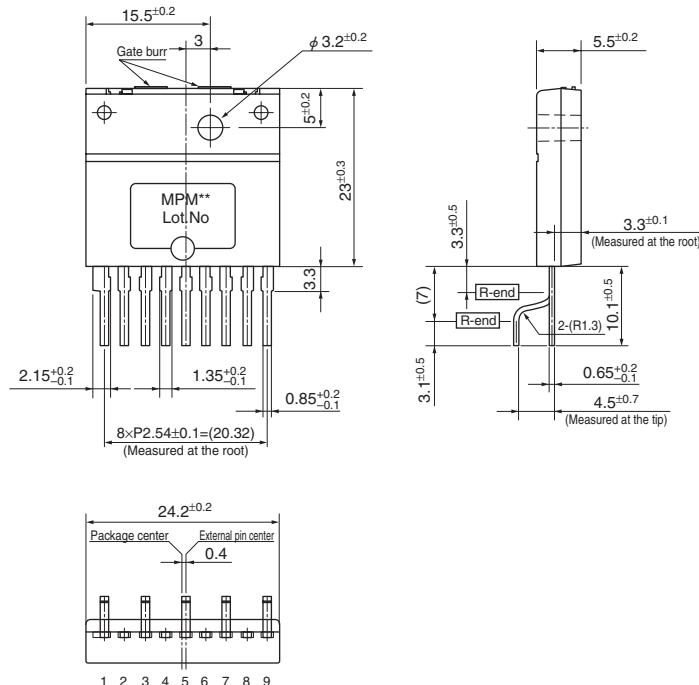

*7: The line/load regulations do not include the setting deviation of the output voltage. The output voltage setting deviation is affected by the precision of the external RFB.

*8: When an output voltage of other than VO=12V is set, the OCP operation point may fluctuate compared to the point when VO=12V because the inductance of the built-in coil is constant and the frequency is constant for the specified output voltage.

*9: Auto restore is used for thermal protection.

■Reference Data

BR200 Series 12V System, For Intermediate Bus, Output 20A Type POL Converter Module

■Features

- Industry standard footprint
- Solderability improved by adopting cut through holes
- Low height: 4.2mm
- High power
- High efficiency
BR202: 88.5%typ. (Vin=12.0V, Vo=1.2V, Io=11A)
BR203: 93.4%typ. (Vin=12.0V, Vo=3.3V, Io=12A)
- Downsizing achieved by using high frequency switching technology
- External dimensions 33.02mm×13.46mm×4.2mmH
